NVIDIA NEMO TOOLKIT

用于构建 SOTA 模型的对话式AI工具库

- . 可以构建基于深度学习的语音和语言理解模型
- . 集成NLP自然语言处理, ASR自动语音识别, TTS语音合成
- 多语言支持
- . 完全开源,简单易用的APIs
- 整合PyTorch & PyTorch Lightning深度学习框架
- . 基于GPU并行加速计算框架CUDA
- 多卡分布式训练混合式精度计算加速训练过程
- . 100+ NGC预训练模型拿来即用

NeMo能做什么

NeMo 推理代码示例

3行代码语音识别ASR

```
import nemo.collections.asr as nemo_asr
asr_model = nemo_asr.models.EncDecCTCModel.from_pretrained(model_name="stt_zh_citrinet_512")
result = asr_model.transcribe(paths2audio_files = ["/root/al.wav"])
print(result)
```

3行代码机器翻译NMT

```
import nemo.collections.nlp as nemo_nlp
nmt_model = nemo_nlp.models.MTEncDecModel.from_pretrained(model_name="nmt_zh_en_transformer6x6")
result = nmt_model.translate(text)
print(result)
```

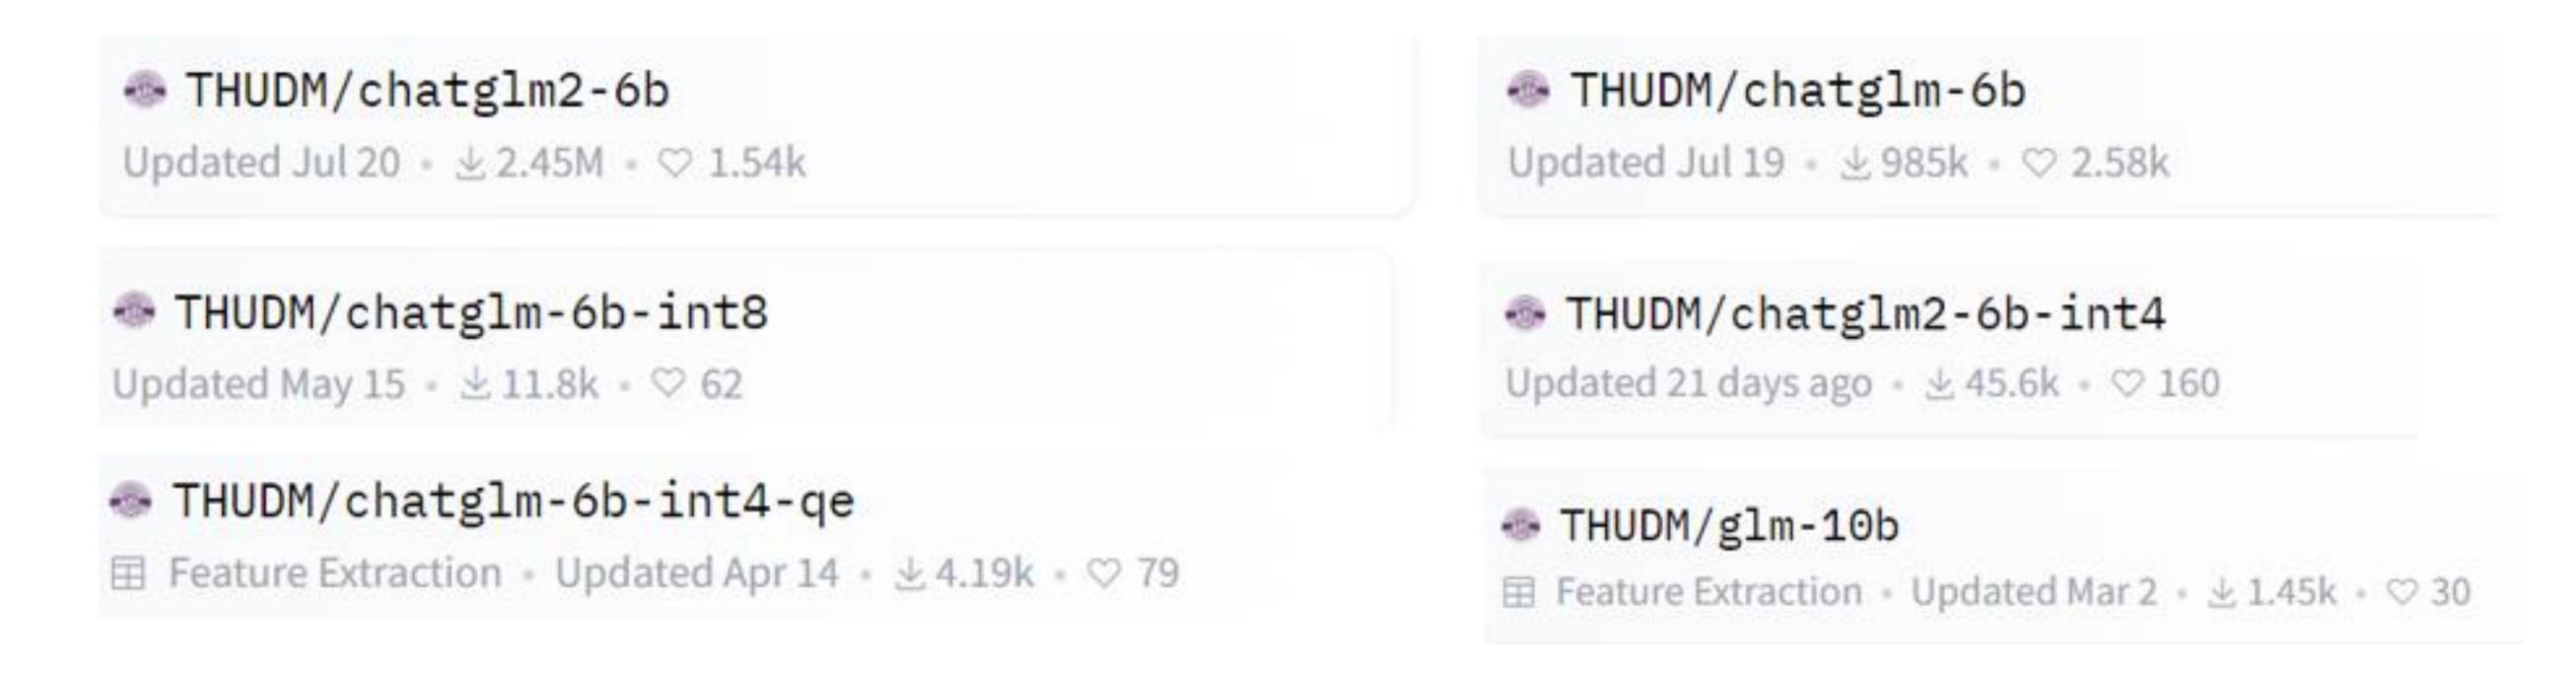

3行代码语音合成TTS

```
from nemo.collections.tts.models import FastSpeech2HifiGanE2EModel
model = FastSpeech2HifiGanE2EModel.restore_from("/home/nvidia/ms_chatbot/tts_en_e2e_fastspeech2hifigan.nemo")
tokens = model.parse[response]
audio = model.convert_text_to_waveform(tokens=tokens)
```

```
import IPython
IPython.display.Audio(audio.to('cpu').detach().numpy(), rate=22050)
```

中文LLM大语言模型ChatGLM介绍

ChatGLM-6B 是一个开源的、支持中英双语的大语言模型,使用了和 ChatGPT 相似的技术,针对中文问答和对话进行了优化,结合模型量化技术,用户可以在消费级的显卡上进行本地部署。ChatGLM2-6B 是ChatGLM-6B 的第二代版本,更强大的性能、更长的上下文、更高效的推理、更开放开源。

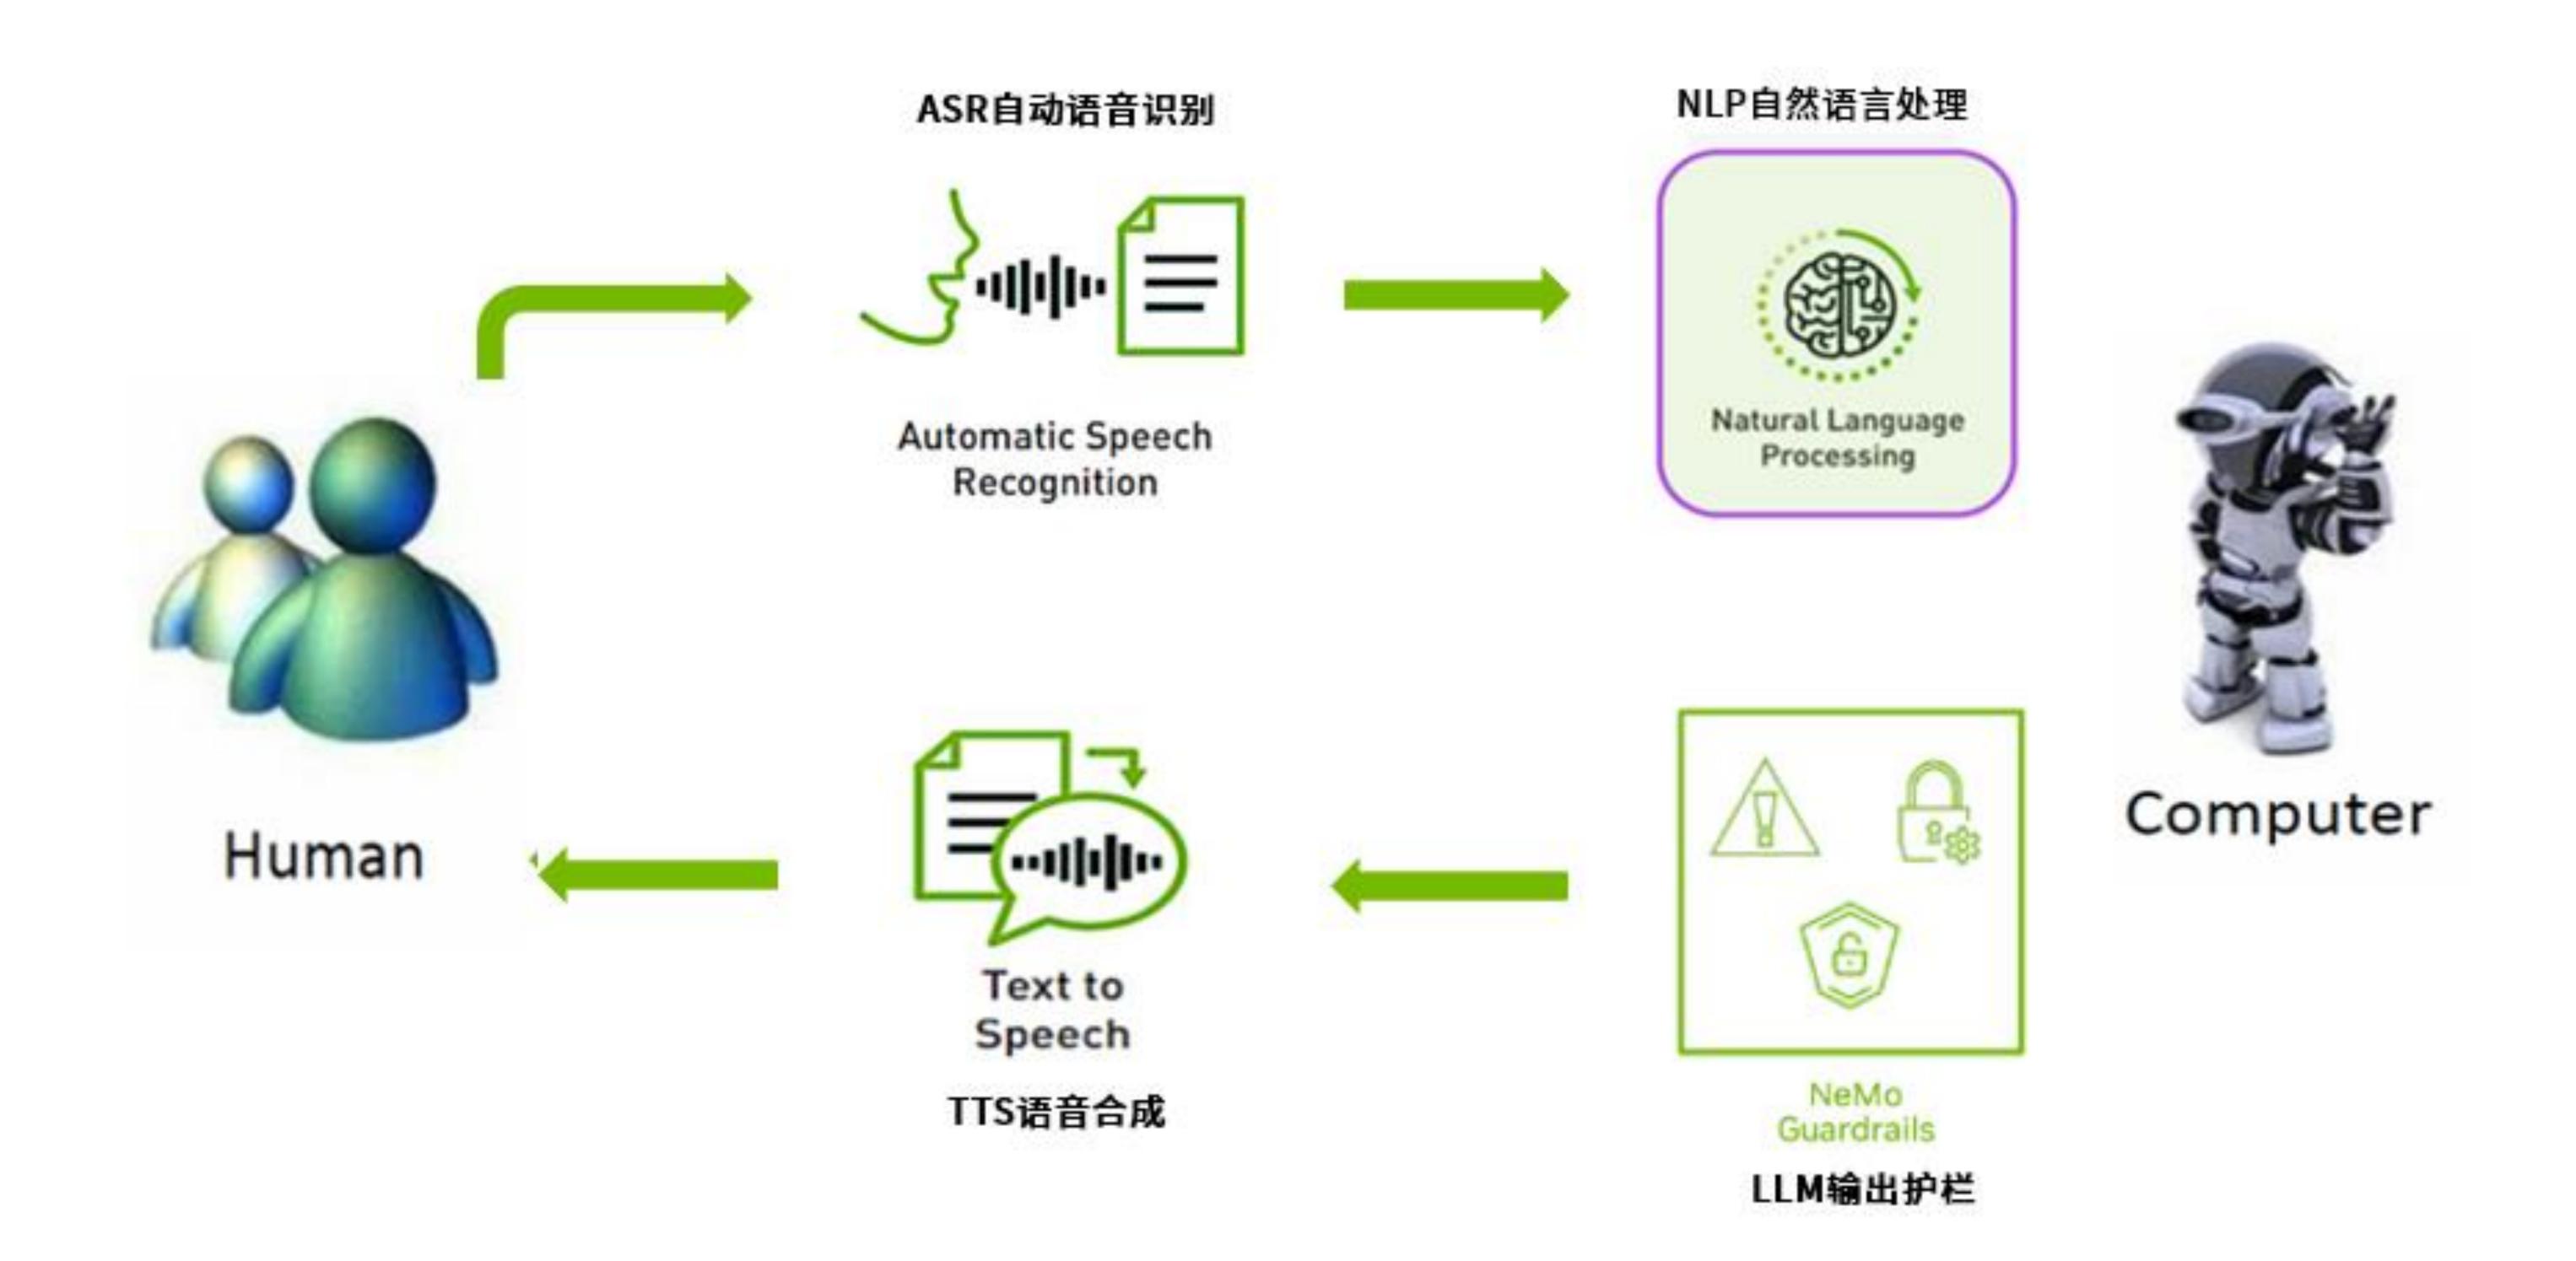

代码调用 ChatGLM2-6B 模型来生成对话

```
from transformers import AutoTokenizer, AutoModel
tokenizer = AutoTokenizer.from_pretrained("THUDM/chatglm2-6b", trust_remote_code=True)
model = AutoModel.from_pretrained("THUDM/chatglm2-6b", trust_remote_code=True, device='cuda')
model = model.eval()
response, history = model.chat(tokenizer, "你好", history=[])
print(response)

▶ !我是人工智能助手 ChatGLM2-6B,很高兴见到你,欢迎问我任何问题。
```

NeMo+ChatGLM对话式AI-人机交互

NeMo对话式AI-人机交互demo

```
import nemo.collections.asr as nemo_asr
citrinet = nemo_asr.models.EncDecCTCModel.from_pretrained(model_name="stt_zh_citrinet_512")
asr_result = citrinet.transcribe(paths2audio_files=["tianqi.wav"])
asr_result[0]
```

ASR语音识别 构建机器的"耳朵"实现听写的过程

'今天天气如何'

```
from transformers import AutoTokenizer, AutoModel
tokenizer = AutoTokenizer.from_pretrained("THUDM/chatglm2-6b", trust_remote_code=True)
model = AutoModel.from_pretrained("THUDM/chatglm2-6b", trust_remote_code=True).quantize(8).cuda()
model = model.eval()
response, history = model.chat(tokenizer, asr_result+"10个字以内", history=[])
print(response)
```

NLP+LLM 构建机器的"大脑"理解文字聊天对话

阳光明媚

```
from nemo.collections.tts.models import FastSpeech2HifiGanE2EModel
model = FastSpeech2HifiGanE2EModel.restore_from("/home/nvidia/ms_chatbot/tts_en_e2e_fastspeech2hifigan.nemo")
tokens = model.parse[response]
audio = model.convert_text_to_waveform(tokens=tokens)
```

TTS语音合成 构建机器的"嘴巴"把文字用声音说出来

import IPython
IPython.display

IPython.display.Audio(audio.to('cpu').detach().numpy(), rate=22050)
